1 — Problem

EVIDENCE LIMITS • VERIFY EACH CLAIM

Passing CI does not establish every runtime's availability.

A check on one runner cannot establish that another execution environment is usable.

Intended execution context _____
CI runner _____
Account access _____
Owner release _____

2 — Method

EVIDENCE LIMITS • VERIFY EACH CLAIM

Probe the intended environment. Record runner checks separately.

Attempt a harmless command where the work is intended to run and keep that observation distinct from CI evidence.

Intended execution context _____

CI runner _____

Account access _____

Owner release _____

3 — Evidence

EVIDENCE LIMITS • VERIFY EACH CLAIM

Name what ran, where it ran and what remains unverified.

Report the actual check, its environment and its practical limits without inventing connectivity or release authority.

Intended execution context _____
CI runner _____
Account access _____
Owner release _____

REVIEW CANDIDATE • UNPUBLISHED

4 — Next step

If blocked, retain the task and checkpoint. Reconcile before retry.

Preserve unfinished work and its last evidence. Do not create duplicate work or infer recovery without a later successful actual command.

Intended execution context _____
CI runner _____
Account access _____
Owner release _____
